To Whom it may concern,

It is my pleasure to recommend Global Eng for the supply of fabricated steel to the Australian Commercial building industry.

We have successfully completed a number of projects with Global over the last 3 years. Our engagement of Global Eng for structural steel originated from a lack of local resources to supply Structural Steel to our projects. Global presented an offer for shop detailing, Manufacture and Delivery to project within project budget and time restraints. Global Engineering have overdelivered on all aspects of the supply agreement.

Shop Drawings and Detailing for all projects was outstanding. We engaged in regular design meetings to review 3D modelling of structural steel and overall coordination with all project documents, requirements, and restrictions. Items identified during reviews were actioned immediately and updated drawings and details were provided in a timely manner. Live modelling information was always available. Our projects were design and construct and, in many instances, Global Eng's ability to accommodate design changes was also met with enthusiasm and accuracy.

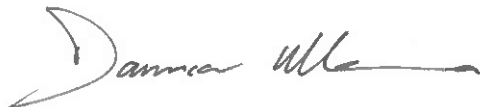

Sourcing offshore structural steel introduced some complexities which required some member size changes. Any proposed substitute members were all reviewed and checked with the project engineer prior to fabrication and without exception, Global Eng provided all necessary compliance documents for all structural members being included in the design.

Fabrication from approved drawings was timely and regular updates were provided throughout the manufacturing process. Every fabricated element was labelled and tagged for easy identification. All corners / exposed edges were protected following paint treatment to prevent damage in transit. Every shipping dispatch was supported with full documentation of packed itinerary. All materials were packed into purpose-built racks with certified lifting points for easy unloading on delivery to site. Each container of steel was coordinated to suit the rigging process on site and priority items were easily identified and packed for easy removal on delivery to site.

On delivery to site, Global Eng provided excellent onsite support for rigging crews. On the larger projects they had regular site visits to view progress and assist with any queries. The software they use allows for checking of installed steel on site. On occasion there were members that did not fit as documented due to on-site tolerances or needed to be changed due to changes in methodology. In each instance Global Eng had the ability to modify steel members locally with minimal disruption to progress on the project.

We will look forward to ongoing relationship with Global Eng for the supply of Structural Steel on future projects.

Regards
